

Can you predict your future revenue?

If only you could see how that campaign you're crafting will hit your bottom line. Data Scientist *Vasileos Vasileo* explains

What is Project Babochka and what does it do?

Project Babochka is an algorithm that predicts future revenue and return on marketing investment. It manages independent variables to increase the revenue and profit generated by marketing.

Every company that sends marketing communications wants its campaigns to be successful. The purpose of this project is to receive input for your marketing strategy and to fine tune controllable campaign details. This will set you up for success.

How does it do this and what does it do with the data?

The algorithm uses historical campaign data taken from a report we compile called Fernando. This report contains the initial set up of each marketing communication such as the number of customers the campaign is reaching, the product the campaign is advertising – for example, credit cards and loans – and how effective the campaign was. Effectiveness is measured by KPIs such as revenue and return on marketing investment.

We focus on the campaigns sent via the email channel. We augment data by including more variables that we see from our side, such as the percentage of the customer segments the email campaign is reaching – for example 20% mass customers, 50% advance customers, 30% premier customers – and what times the campaign is going out. It might be that 20% of emails are sent in the morning and 80% in the evening.

“The purpose of this project is to fine tune controllable campaign details. This will set you up for success”

We assess and quantify all the correlations between the variables we or the client can control, including campaign volume, product and segment split and the KPIs. By looking at these correlations, we can then predict the efficiency of a future campaign by combining these variables and the correlations found in the historical data.

Who came up with it and where did the idea come from to create it?

The idea came from our head of data science Henrik Nordmark and me. It originated from ongoing research and development that we carry out as part of our knowledge transfer partnership with the University of Essex. It was then developed by our teammate Diyora Makhmudova, who named it Babochka – ‘butterfly’ in Russian.

It is the first step in our long-term mission to create predictive attribution modelling that will determine the optimum marketing mix of direct mail, email, SMS and other channels.

Almost since joining Profusion, I've been working very closely with our in-house marketing effectiveness team for a major retail bank, which is using the Fernando report to assess the impact of its marketing communications.

The first thing Henrik and I noticed is that they are essentially trying to identify these correlations with the human eye, by looking at campaign KPIs and trying to see what went wrong or what went well. As we believe an algorithm is almost always better than the human eye at recognising patterns in data, we decided it would be very useful for them and other marketing effectiveness teams.

Wired to solve problems

We're a clever team of specialists in data engineering, BI, data science and multi-channel marketing.

Blending real 1:1 communications, AI, machine learning and human intelligence, we connect people with your brand.

We were the original UK partner for Adobe Campaign. We've nearly 20 years' experience in data management, automation and customisation of enterprise data management and marketing other platforms.

Fuelled by inquisitiveness, forward thinking and excitement at the advancements of technology, we're entrepreneurial, adventurous and we make stuff happen.

We help clients get under the skin of a human being's emotional narrative – their story – and see what's important to each customer.

Our clients trust us for our responsive, personal and upfront approach to help them create highly targeted, intelligent communications.
